

Robotic Automation:

MYTHS vs FACTS

MYTHS

FACTS

Automation will replace all my labor and my workforce will no longer be needed.

Automation will work alongside your existing workforce, freeing up workers for more strategic and creative tasks.

My workforce fears that their jobs will be taken by automation, and they will be reluctant to adopt.

Workers believe that automation makes their jobs safer and allows them to be more productive and accurate.

Everyone will happily adopt automation without any training or change management programming.

Training and change management are critical parts of an automation implementation to gain buy-in from personnel.

Automation isn't safe and my employees could be hurt as a result of the robots working alongside them.

Robots have built-in safety measures like sensors and software that enable them to safely navigate an environment and avoid collisions.

My technicians won't be able to support a complicated automation system.

Specialized training will enable technicians to become highly proficient at servicing automated equipment.

"...robots won't replace workers in the near term, but rather make them more efficient and productive. Humans will be crew chiefs, commanding and maintaining teams of robots."

Rueben Scriven, Research Manager at Interact Analysis
